Watchlog summary

Oct 16, 2026 · @Jakob

Watchlog is a small Windows program I built that types our standard log entries. You type a short code like `;interior` or `;medical`, fill in the details that change, and the finished entry goes into iTrak. You still read it over and save it yourself, same as now.

Why it's worth trying

- About 2,000 keystrokes and 14 minutes saved per shift by my count, roughly 42 hours a year per operator. The pilot would time it properly.
- Everyone works from the same approved wording, so entries are consistent.
- Fewer typos and missed details: times come from the clock, numbers are formatted for you, and a blank box shows up as XXXXX.
- New operators can search templates by any word, so there's nothing to memorize.

Security

- Passwords are kept in Windows Credential Manager on each PC, never in a file and never synced.
- It doesn't connect to the internet, send anything anywhere, record what you type, or change anything in iTrak.
- The only copy of log text it keeps is each operator's own shift journal, which is deleted after 30 days.
- The shared wording sits in a SharePoint folder that the approved supervisors have access to. Each PC shows a check code proving it has the approved version, and a Security and status report listing everything the tool has saved there.

What I'm asking for

A pilot. I'd need the supervisors named by management to approve the wording, a SharePoint folder for the shared file, and IT to check the password storage, the automatic logins, installing AutoHotkey and starting it with Windows. The full overview has all the details.
