Watchlog - Demo Run Sheet

Oct 21, 2026 · @Jakob

This is a 10 to 15 minute walk-through for showing Watchlog working. Do it in Notepad, not in a real iTrak entry, and use made-up numbers like Dealer #123456 so nothing real ends up on screen. Each test shows what to type, what should appear, and one line to say.

Before he arrives

- [ ] Watchlog is running (teal icon by the clock) and the tray menu shows the current version.
- [ ] Open a blank Notepad window to paste into.
- [ ] OneDrive is running, so the templates are the current ones.
- [ ] Close or cover any real iTrak entries, player numbers and employee numbers.
- [ ] Have the overview printed, with the one-page summary on top.

The demo

#	Test	What to type or press	What should appear	What to say
1	A quick entry	`;interior`	Security Supervisor performed interior door check, instantly	9 keystrokes instead of about 50.
2	A form with defaults	`;evict`, then Enter	The full trespass entry, with the preview filling in as the boxes change	Tab moves between boxes and Esc cancels. I still read it over and save it myself.
3	Picking from a list	`;evict`, drop down the Reason box	Three reasons to pick from	Wording stays the approved wording.

#	Test	What to type or press	What should appear	What to say
4	An audit	`;audit`, pick Dealer, type 123456, type M3, Enter	Surveillance observed Dealer #123456 from (time now) - (20 minutes later) on M3. Nothing suspicious observed.	The times fill themselves in.
5	Several patrons refused	`;refuse`, pick 2 patrons and no ID, Enter	Security Officer refused entry to 2 patrons due to no ID.	One template covers every refusal reason and any number of patrons.
6	Signs observed	`;refuse`, pick showing signs of intox, type slurred speech in the third box, Enter	...due to showing signs of intox (slurred speech).	The brackets only appear when something is typed.
7	Formatting for you	`;jack`, type 10000 as the amount, b1410 as the machine, 3 as the window, 2130 as the time paid	A jackpot entry with $10,000, B1410 and 21:30	Money, capitals and times come out formatted the same way every time.
8	A missing detail	`;aml`, type b1410 as the machine and leave the alert number empty	AML Alert #XXX populated at B1410...	A blank box shows as XXX or XXXXX, so a missing detail is easy to spot.
9	Several in one log	`;bv`, enter a machine and asset number, press Ctrl+Enter, add a second one, Insert	Two lines in one entry	Add another keeps the earlier ones in the preview.
10	A table shortcut	`;fill`, type 202 in the table box, 5000 as the amount	FB202 $5,000	Typing just the number picks the table.

#	Test	What to type or press	What should appear	What to say
11	Can't remember a code	Ctrl+Alt+Space, type trespass	`;evict` listed, with the wording shown below	New operators can search by any word.
12	Every code at a glance	Ctrl+Alt+H	The cheat sheet	One list of every code.
13	Time stamps	`;t`, `;dd`, `;dt`	The time, the date, or both	Instant, no form.
14	A quick note	Ctrl+Alt+Q, type a made-up note, OK	The note saved to Quick Notes	Handy for a reminder in the middle of a shift.
15	The shift journal	Ctrl+Alt+J	How many of each log this shift, and the time saved so far	Copy summary gives the one-line summary for the End of Shift entry.
16	Time saved	Tray menu, Time saved	Logs, logins, keystrokes and time for this shift, today, the week and the month	It only counts what I actually saved, and stores numbers, never log text.
17	Security	Tray menu, Security and status	Passwords saved in Credential Manager only, none in a file, and which template file is in use	This is everything it saves, and it can be sent to IT with Copy report.
18	The approved version	Click the version line at the top of the tray menu	Up to date, and the check code	Same code on two PCs means the same approved wording.

Describe, don't demonstrate

These change the screen, so talk through them rather than running them on a real shift.

- Ctrl+Alt+L opens SDS, AlertGrid and CMP first, then the work websites, and ends on the Citrix page. It takes about 20 seconds.
- Ctrl+Alt+Shift+L asks first. If you say yes it logs out of SDS properly, then closes the work apps. If you show it, answer No.
- Ctrl+Alt+K logs out of SDS properly on its own, so nobody gets locked out.
- The logins type a username and password from Windows Credential Manager. Never show a password on screen.

If something goes wrong

- A form won't go away: press Esc.
- A code doesn't fire: check the cheat sheet (Ctrl+Alt+H) for the exact code. It needs the semicolon.
- Watchlog seems stuck: right-click the tray icon and choose Reload Script.
- Nothing pastes into iTrak through Citrix: the finished entry is still on the clipboard, so press Ctrl+V once more, or paste into Notepad first.
